Suppose that  $G \subseteq S_X$  be a subgroup of  $S_X$ , the symmetric group on  $X$ . I am looking for a method to enumerate the non-trivial conjugacy classes of  $G$ . When  $X = \{1, 2\}$ , there is the famous method of generating trees with the help of  $G$ , where each cycle of the tree counts a conjugacy class. However I have no idea how to generalize it to the more complicated case. For instance, if  $X = \{1, 2, 3, 4\}$ , how would one go about counting the non-trivial classes of the cyclic group generated by  $(2, 3)(4, 1)$ ? A: The problem can be reformulated as follows. Let  $G$  be a subgroup of the symmetric group  $S_n$ . Let us assign to  $G$  a labelled graph  $G'$  with vertices  $\{1, 2, 3, \dots, n\}$ , and edges  $S_{ij}$  with labels  $S_{i=j+1}$  or  $S_{i=j-1}$ . It is easy to see that the set  $C$  of conjugacy classes of  $G$  is equal to the set
