Previous version of this article was available as at 2019-09-01 22:23:12. This page was last edited on 01-Oct-2016 05:17:40. Current treatment of brain metastases in breast cancer. Breast cancer patients with brain metastases have poor prognosis, and treatment is mostly palliative. The use of stereotactic radiosurgery has improved patients' survival, but it has to be preferred to whole brain radiotherapy in patients with Karnofsky performance status score  $\geq 70$ -80%. No other efficient treatment is available to date. With the development of new targeted therapies and the better understanding of intracranial biology, some of these tumors might become a new therapeutic target and benefit from these new drugs. Q: Commutativity of following diagram With a traditional category as the source, I am having trouble visualizing the following commutative diagram: (from G. I. Olariu, "Cup Product of Categories", 1989) Can someone give a nice explanation of what is going on here? A: The two arrows  $F \rightarrow i$  and  $G \rightarrow i$  are both commutative diagrams. Therefore there is a unique arrow  $F \cup_i G \rightarrow i$  such that the following diagram commutes The counit  $j \circ i \rightarrow \text{trm}\{id\}_{\text{trm}\{Cat\}_1}$  becomes the counit  $j_* \circ i_* \rightarrow \text{trm}\{id\}_{\text{trm}\{Cat\}_2}$  ba244e880a
