This brings up the following question: Why would you use key signing if you are just going to XOR the key with itself? What purpose does this serve? An Exploratory Study on the Mechanism of Decreased GFR in Migraine: The Effect of Migraine and a Migraine Attack on Renal Function. A few studies have assessed the mechanisms of decreased glomerular filtration rate (GFR) in migraine, especially in the acute state. We aimed to compare serum levels of inflammatory cytokines and their correlations with GFR in migraine patients without acute kidney injury (AKI) and migraine patients with AKI, as well as in controls. Twenty-five migraine patients and 25 healthy subjects (HS) were enrolled in the study. The migraine patients were grouped according to the presence of AKI as defined by the KDIGO classification as AKI or non-AKI migraineurs. Blood samples were taken from all participants to measure serum levels of interleukin (IL)-1 β , IL-6, IL-17, and tumor necrosis factor- α (TNF- α), and GFR was measured by the Cockcroft-Gault equation. There was no significant difference between patients and HS in serum levels of IL-1 β , IL-6, IL-17, and TNF- α and between patients in different groups. No significant correlation was found between IL-1 β , IL-6, IL-17, TNF- α and GFR in both groups. Similarly, no significant correlation was found between inflammatory cytokines and GFR in the migraine group. The serum IL-6 levels were significantly higher in the AKI group than in the non-AKI group. IL-6 levels were not significantly different between controls and HS. Renal function in patients with migraine and AKI is not associated with the serum levels of IL-1 β , IL-6, IL-17, and TNF- α , and may be mediated by other factors. Inflammatory cytokines in patients with migraine
